Art Unit: 2193

DETAILED ACTION

- 1. This action is responding to application papers dated on 4/26/2004 and 3/30/2004.
- 2. Claims 1-20 are pending in the application.

Specification

3. Applicant is reminded of the proper content of an abstract of the disclosure.

A patent abstract is a concise statement of the technical disclosure of the patent and should include that which is new in the art to which the invention pertains. If the patent is of a basic nature, the entire technical disclosure may be new in the art, and the abstract should be directed to the entire disclosure. If the patent is in the nature of an improvement in an old apparatus, process, product, or composition, the abstract should include the technical disclosure of the improvement. In certain patents, particularly those for compounds and compositions, wherein the process for making and/or the use thereof are not obvious, the abstract should set forth a process for making and/or use thereof. If the new technical disclosure involves modifications or alternatives, the abstract should mention by way of example the preferred modification or alternative.

The abstract should not refer to purported merits or speculative applications of the invention and should not compare the invention with the prior art.

Where applicable, the abstract should include the following:

- (1) if a machine or apparatus, its organization and operation;
- (2) if an article, its method of making;
- (3) if a chemical compound, its identity and use;
- (4) if a mixture, its ingredients;
- (5) if a process, the steps.

Extensive mechanical and design details of apparatus should not be given.

The abstract does not contain a concise statement of the technical disclosure of the invention.

Drawings

4. Figure 1 should be designated by a legend such as --Prior Art-- because only that which is old is illustrated. See MPEP § 608.02(g). Corrected drawings in compliance with 37 CFR 1.121(d) are required in reply to the Office action to avoid abandonment of the application. The

Art Unit: 2193

replacement sheet(s) should be labeled "Replacement Sheet" in the page header (as per 37 CFR 1.84(c)) so as not to obstruct any portion of the drawing figures. If the changes are not accepted by the examiner, the applicant will be notified and informed of any required corrective action in the next Office action. The objection to the drawings will not be held in abeyance.

Claim Objections

5. Claim 9 is objected to because of the following informalities: "a operation" should be corrected to "an operation." Appropriate correction is required.

Claim Rejections - 35 USC § 102

6. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

- (b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.
- 7. Claims 1-8, 11, 13-15, and 17-20 are rejected under 35 U.S.C. 102(b) as being anticipated by Ball et al. ("Efficient Path Profiling," IEEE, pages 1-12, 1996) hereafter Ball.

Per claim 1:

Ball discloses:

generating a trace for a subset of program instructions formed from a set of program instructions, with said trace comprising a path identifier value, start address, and end address (i.e. "The path profiling algorithm first labels edges in a DAG with integer

values, such that each path from the entry to the exit of the DAG produces a unique sum of the edge values along that path," page 4, right col., second paragraph);

- storing said trace in a trace buffer (i.e. "a trace buffer that records branch outcomes," page 4, left col., second paragraph);
- retrieving said trace from said trace buffer and reproducing said subset of program instructions using said trace (i.e. "To recreate a path profile from the path counters recorded at run time, it is necessary to map from integer representing a path to the path itself...the reconstructed path," page 6, right col., 3.5 Regenerating a Path section, lines 1-11).

Per claim 2:

Ball further discloses:

-receiving an endpoint program instruction for said subset of program instructions (i.e., page 2, right col., lines 6-9);

- generating said path identifier value and end address for said subset of program instructions (i.e. page 2, right col., lines 10-13);
- retrieving said start address from a program counter register (i.e. page 2, right col., second paragraph lines 1-6)

generating said trace using said path identifier value, start address and end address (i.e. page 5, left col., section 3.2 Compactly Representing Paths with Sums, lines 1-6).

Per claim 3:

Application/Control Number: 10/814,374 Page 5

Art Unit: 2193

Ball further discloses:

- initializing a path identifier register, with said path identifier register to store said end

address and said path identifier value (i.e. page 6, section 3.4 Instrumentation, second

paragraph)

- assigning each unconditional branch instruction for said set of program instructions

an unconditional partial path value and an unconditional offset value (i.e. page 3, left

col., third paragraph, lines 8-12)

and assigning each conditional branch instruction for said set of program instructions

a taken branch partial path value, an untaken branch partial path value, and a

conditional offset value (i.e. page 2, right col., first paragraph, lines 5-8, 14-15).

Per claim 4:

Ball further discloses:

- receiving a branch and determining whether said branch instruction is a conditional

branch instruction or unconditional branch instruction (i.e. page 2, right col., first

paragraph, lines 5-8)

incrementing said path identifier value with said unconditional partial path value and

said end address with said unconditional offset value if said branch instruction is an

unconditional branch instruction (i.e. page 6, section 3.4 Instrumentation, second

paragraph; page 2, Figure 2)

incrementing said path identifier value with said taken branch partial path value and

said end address with said conditional offset value if said branch instruction is a

Application/Control Number: 10/814,374 Page 6

Art Unit: 2193

conditional branch instruction that was taken; and incrementing said path identifier

value with said untaken branch partial path value and said end address with said

conditional offset value if said branch instruction is a conditional branch instruction

that was untaken (i.e. "Taking a conditional branch narrows the set of potential paths

and corresponds to a transition to a new state," page 2, right col., lines 5-6; "At the

end of the loop body...register r holds the index to increment an array of counters,"

page 2, right col., second paragraph lines 3-6).

Per claim 5:

Ball further discloses:

- comprising initializing said path identifier register prior to processing another

conditional branch instruction (i.e. "initializing path register r[r=0] in the ENTRY

vertex," page 6, right col., 3.4 Instrumentation, second paragraph, lines 2-3).

Per claim 6:

Ball further discloses:

-said subset of program instructions comprises a function (i.e. "the execution of a local

portion of a program, such as routine," pages 1, right col., paragraph 1).

Per claim 7:

Ball further discloses:

Art Unit: 2193

- wherein said path identifier and end address each comprise 32 bits (i.e. "the states can

Page 7

be represented as 32-bit integers," page 3 right col., section 1.3, second paragraph, line

9).

Per claim 8:

Ball further discloses:

- wherein said conditional branch instruction and said unconditional branch instruction

each comprise 32 bits (i.e. "the states can be represented as 32-bit integers," page 3

right col., section 1.3, second paragraph, line 9).

Per claims 11 and 13, they are the apparatus versions of claim 1, respectively, and are

rejected for the same reasons set forth in connection with the rejection of claim 1 above.

Per claim 14:

Ball discloses:

- a path identifier register (i.e. page 8, section 5.1 Registers, "a local register...to hold

the current path," lines 1-4)

a program counter register (i.e. counter, page 6, left col., 3.4 Instrumentation, second

paragraph, line 5)

and a path identifier generator operatively coupled to said path identifier register and

said program counter register, said path identifier generator to receive an endpoint

Art Unit: 2193

program instruction for said subset of program instructions, to generate said path

Page 8

identifier value and end address for said subset of program instructions using said

path identifier register, to retrieve said start address from a program counter register,

and generate said trace using said path identifier value, start address and end address

(i.e. "initializing path register r[r=0] in the ENTRY vertex," page 6, right col., 3.4

Instrumentation, second paragraph, lines 2-3; page 5, left col., section 3.2 Compactly

Representing Paths with Sums, lines 1-6; page 2, right col., lines 10-13).

Per claims 15, 17, and 18, they are the wireless system versions of claims 11, 13, and 14,

respectively, and are rejected for the same reasons set forth in connection with the rejection of

claims 11, 13, and 14 above.

Per claims 19 and 20 they are another method versions of claims 11, 13, and 14,

respectively, and are rejected for the same reasons set forth in connection with the rejection of

claims 11, 13, and 14 above.

8. Claims 9, 10, 12, and 16 are rejected under 35 U.S.C. 102(b) as being anticipated by Ball

et al. ("Efficient Path Profiling," IEEE, pages 1-12, 1996) hereafter Ball in view of Mann (US

Patent 6,094,729).

Per claim 9:

Art Unit: 2193

Ball does not explicitly teach that said conditional branch instruction and said unconditional branch instruction further comprise an operation code value to identify a type of instruction. However, Mann teaches such an operation code value was known in the pertinent art, at the time applicant's invention was made, to indicate the data type (i.e. col. 3 lines 3-9). It would have been obvious for one having ordinary skill in the art to modify Ball's disclosed system to incorporate the teachings of Mann. The modification would be obvious because one having ordinary skill in the art would be motivated to indicate the data type to identify different types of instructions fast (i.e. col. 3 lines 3-9).

Per claim 10:

Ball discloses that said trace buffer comprises N entries (i.e. "a trace buffer that records branch outcomes," page 4, left col., second paragraph). Ball does not explicitly teach moving traces from said trace buffer to another storage location after storing N entries. However, Mann teaches it was known in the pertinent art, at the time applicant's invention was made, to move trace data into another storage if desired (i.e. col. 24 lines 5-15). It would have been obvious for one having ordinary skill in the art to modify Ball's disclosed system to incorporate the teachings of Mann. The modification would be obvious because one having ordinary skill in the art would be motivated to move the trace data into memory when the trace buffer is not available for storing the traces (i.e. col. 24 lines 5-15).

Per claim 12, this claim is the apparatus version of the claimed method discussed in claim 10, wherein all claim limitation also have been addressed and/or covered in cited areas as set forth the above.

Application/Control Number: 10/814,374 Page 10

Art Unit: 2193

Per claim 16, this claim is the system version of the claimed method discussed in claim

10, wherein all claim limitations also have been addressed and/or covered in cited areas as set

forth the above.

9. Any inquiry concerning this communication or earlier communications from the

examiner should be directed to Insun Kang whose telephone number is 571-272-3724. The

examiner can normally be reached on M-F 8:30-5 PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's

supervisor, MENG AI AN can be reached on 571-272-3756. The fax phone number for the

organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent

Application Information Retrieval (PAIR) system. Status information for published applications

may be obtained from either Private PAIR or Public PAIR. Status information for unpublished

applications is available through Private PAIR only. For more information about the PAIR

system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR

system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would

like assistance from a USPTO Customer Service Representative or access to the automated

information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
